BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence represents an antigenic peptide from human telomerase reverse transcriptase (hrRT), from the present invention. The present invention also describes the following methods: (A) determining present invention also describes the following methods: (A) determining the change whether a test compound is a modulator of hrRT, by detecting the change compound; (B) preparation of polymucleotide, on administration of the compound; (C) protein preparation of the hrRT with a telomerase BNA component; (C) protein preparation of hrRT with a telomerase RNA component; (C) protein of the hrRT RNA or protein in a sample by binding a relevant certain of the hrRT RNA or protein in a sample by binding a relevant certain of the hrRT RNA or protein of and detecting the product and correlating the presence of probe or amplification product with presence of hrRT in the sample; (C) hrRT expression; and (E) the use of an agent that causes an increase in complex or amplification of hrRT and the polymucleotide encoding ageing. A protein preparation of hrRT and the polymucleotide encoding consecution to age of an agent that inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be effect of ageing or cancer. Inhibitors of telomerase activity can be considered by a protein preparation of hrRT can also be used in the manufacture of medicaments for inhibiting the consecution of hrRT can also be used in the manufacture of medicaments for inhibiting the effect of ageing or cancer. Inhibitors of telomerase activity can be consecuted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; telomerase reverse transcriptase; hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein;
                                                                                                     Pure and recombinant human Telomerase Reverse Transcriptase and variants - are useful in the diagnosis, prognosis and treatment cell proliferation conditions especially cancer and ageing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human telomerase reverse transcriptase antigenic peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 114; DB 19;

The present sequence represents an antigenic peptide from human closures reverse transcriptes (hTRT), from the present invention. The telomerase reverse transcriptes (hTRT), from the present invention. The present invention also describes the following methods: (A) determining present invention also describes the following methods: (A) determining compound is a modulator of hTRT, by detection of the compound is a modulator of hTRT, by detecting a compound; (B) preparation of recombinant telomerase by contacting a compound; (B) preparation of hTRT with a telomerase by contacting a relevant correlation of the hTRT RNA or protein in a sample by binding a relevant complex to the sample and detecting the complex formed or in the case of probe to the sample and detecting the protein of a vertebrate cell by increasing and (D) increasing the proliferation of a vertebrate cell by increase in complex or amplification product with presence of hTRT in the sample cell vertebrate cell proliferation of an agent that causes an increase in threat on the proliferation of hTRT and the polymucleotide encoding ageing. A protein preparation of hTRT and the polymucleotide encoding confert of againg or cancer. Inhibitors of telomerase activity can be effect of againg or cancer. Inhibitors of telomerase activity and the new activity. A protein preparation of hTRT can also be used in the new activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                           Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Catalytic telomerase; diagnosis; disease; telomerase activity.

The present invention relates to a polypeptide comprising a 20 amino acid sequence derived from human telomerase catalytic subunit (or human telomerase reverse transcriptase, hTERT) amino acid residues 537-556, or fragments thereof comprising at least 10 amino acids and at least two human leukocyte antigen (HLA) class I or class II epitopes. The invention also describes a polypeptide having the above 20 amino acid peptide sequence as additional C- and/or N-terminal sequences on a fragment of hTERT which is not more than 100 amino
                                                                  New catalytic protein of telomerase of a higher animal and a gene coding it - useful for diagnosis of diseases caused by the change in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; telomerase catalytic subunit; hTERT; human leukocyte antigen; human telomerase reverse transcriptase; HLA epitope; cancer; HLA profile; breast cancer; pancreatic cancer; colorectal cancer; lung cancer; ovarian cancer; carcincal cancer; malignant melanoma; leukaemia; lymphoma; biliary tract carcinoma; anti-cancer; mutant; cytostatic; HLA class I epitope; HLA class II epitope; mutein.
                                                                                                                                                                      The specification describes a human catalytic telomerase protein. The products are useful in drug compositions for the diagnosis of diseases caused by the change in activity of telomerase. The present sequence appears in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         hTERT fragment with HLA containing polypeptide at its N-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide with an additional C-terminal and/or N-terminal sequence, useful for preparing anti-cancer vaccines

The present invention also describes the following methods: (A) determining whether
acids of hTERT. The polypeptides of the invention are useful in a pharmaceutical composition or in a vaccine for preventing or treating cancer in populations of individuals having varying HLA profiles. The polypeptides are also useful in a diagnostic kit for diagnosing cancers such as breast, pancreatic, colorectal, lung, ovarian or cervical cancer, malignant melanoma, leukaemia, lymphoma or biliary tract carcinoma. The polypeptides or encoding polymolectide sequences are useful for performing identity, sequence homology and/or hybridisation studies, for predicting structure and/or function (e.g. anti-cancer activity), or for screening methods in drug development or drug screening procedures. The present sequence represents a hTERT fragment with the 20 amino acid HLA epitope containing polypeptide at its N-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human telomerase reverse transcriptase protein from cDNA clone 712562.

cc recombinant protein or polynucleotide, on administration of the compound; recombinant protein or polynucleotide, on administration of the compound; cc (B) preparation of recombinant telemerase by contacting a protein of recombinant telemerase by contacting a protein of preparation of recombinant telemerase by contacting a presention of preparation of hTRT with a telemerase RNA component; (C) detection of the hTRT RNA or protein in a sample by binding a relevant probe to the sample and detecting the complex formed or in the case of RNA detection, camplifying the product and correlating the presence of hTRT in the sample; and (D) amplification product with presence of hTRT in the sample; and (D) amplification product with presence of hTRT in the sample; and (B) the use of an agent that causes an increasing hTRT increasing the proliferation of a vertebrate cell by increasing hTRT can be used in the manufacture of medicaments for inhibiting the MTRT and the polynucleotide encoding cellect of ageing or cancer. Inhibitors of telomerase activity can be effect to ageing a protein preparation of hTRT can also be used in the new conditions that are associated with high telomerase activity. A protein preparation of hTRT can also be used in the new conditions that are associated with high telomerases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human telomerase reverse transcriptase thing the furgraph invention relates to a monoclonal antibody recognising the hrbra. The antibody can be used for the investigation, diagnosis and treatment of telomerase-related diseases, especially diseases in which telomerase expression is up-regulated e.g. cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New monoclonal antibody recognizing human telomerase catalytic subunit (hTERT) useful for treating and diagnosing cancer -

The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telemerase activity and cancer cells, and to screen telemerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel gene, useful in detection of telomerase activity and cancer cells as well as screening telomerase inhibitors for treatment of

The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer cells, and to screen telomerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                                                                                                                                                                                                        Novel gene, useful in detection of telomerase activity and cancer cells as well as screening telomerase inhibitors for treatment of

The present sequence represents a fusion protein from an example of the present invention which describes human telomerase reverse transcriptes (hTRT). The present invention also describes the fullowing methods: (A) determining whether a test compound is a modulator of hTRT, by detecting the change in hTRT recombinant protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a protein preparation of hTRT with a telomerase by contacting a protein of the hTRT with a telomerase by contacting a protein probe to the sample and detecting the complex formed or in the case of RNA detection, amplifying the product and correlating the presence of complex or amplification product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with presence of hTRT in the sample; and (D) increasing the product with a vertebrate cell by increasing hTRT expression; and (E) the use of an agent that causes an increase in the manufacture of medicament that inhibits desired to again or cancer. Inhibitors of telomerase activity can be used in the manufacture of endicaments for inhibiting the read to the transfer of adelinerase activity can be used in the manufacture of endicaments for inhibiting the read to the product with the produ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

d

AAW47002 standard; Protein; 531 AA.

RESULT 9 AAW47002

Human; telomerase reverse transcriptase; hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein.

Location/Qualifiers

Homo sapiens

Key

Synthetic

Glutathione-S-transferase and hTRT fusion protein 2.

13-AUG-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a human telomerase reverse transcriptase (hTRT) clone protein from the present invention. The present invention also clone protein from the present invention. The present invention also clone protein following methods: (A) determining whether a test compound (E) a modulator of hTRT, by detecting the change in hTRT recombinant protein or polymucleotide, on administration of the compound; (B) protein or polymucleotide, on administration of the compound; (C) detection of preparation of hTRT with a telomerase RNA component; (C) detection of hTRT with a telomerase RNA component; (C) detection of hTRT with a sample by binding a relevant probe to the cample and detecting the complex formed or in the case of RNA detection, camplifying the product and correlating the presence of complex or camplification product with presence of hTRT in the sample; and (D) amplification product with presence of hTRT in the sample; and (E) the use of an agent that causes an increasing hTRT increasing the proliferation of a vertebrate cell by increasing the cyertebrate cell proliferation of hTRT and the polymucleotide encoding vertebrate cell proliferation of hTRT and the polymucleotide encoding celfect of ageing or cancer. Inhibitors of telomerase activity can be effect of ageing or cancer. Inhibitors of telomerase activity, A protein preparation of hTRT can also be used in the new that are associated with high telomerase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing
                     Human telomerase reverse transcriptase 63 kDa clone 712562 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a catalytic telomerase protein. The products are useful in drug compositions for the diagnosis of diseases caused by the change in activity of telomerase.

This invention describes novel human CRT-1 genes and their encoded proteins containing a reverse transcriptase motif, which act as telomerase inhibitors. The gene, its encoded protein and derived antibodies can be used to provide base sequence information, detect telomerase activity and cancer cells, and to screen telomerase inhibitors. The detection method is simple and effective.
                                                                                                                                                                                                                Novel gene, useful in detection of telomerase activity and cancer cells as well as screening telomerase inhibitors for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; telomerase reverse transcriptase; hTRT; TRT; diagnosis; prognosis; cell proliferation; cancer; ageing; ribonucleoprotein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other skin cancers, neuroblastomas, breast carcinomas, colon carcinomas, colon skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As well, many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as wilm's tumour, organ regeneration or differentiation after injury or house. The Crterminus of this sequence can be replaced by the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                     New isolated vertebrate telomerase genes - used to develop products for treating cancers or for organ regeneration, nerve cell or brain cell growth following injury or bone marrow transplantation

The present sequence represents a human telomerase reverse transcriptase (hRRT) variant from the present invention. The present invention also cascribes the following methods: (A) determining whether a test compound ce describes the following methods: (A) determining whether a test compound compound to a modulator of hTRT, by detecting the change in hTRT recombinant protein or polyuncleofide, on administration of thTRT recombinant telomerase by contacting a protein of preparation of hTRT with a telomerase RNA component; (C) detection of preparation of hTRT with a telomerase RNA component; (C) detection of hTRT RNA or protein in a sample by binding a relevant probe to the the hTRT RNA or protein in a sample by binding a relevant probe to the camplifying the product and correlating the presence of complex or amplifying the proliferation of a vertebrate cell by increasing hTRT camplifying the proliferation of an agent that causes an increase in cell expression; and (E) the use of an agent that causes an increase in cell captures of a geing A protein preparation of create a medicament that inhibits of the modern of a protein preparation of a protein cample of a condition of a create a medicament of the cinition of the manufacture of medicaments for inhibiting the the manufacture of the proliferation of the manufacture of the polymorleoptic province of telomerase activity can be used in the manufacture of the clomerase activity can be used to treat conditions that are associated with high telomerase activity can be necessariant that are associated with high telomerase activity of the proliferation of them and a protein of the proliferation of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

```
This sequence is a truncated human telomerase of the invention. Primers that amplify the telomerase coding sequence can be used in a method for diagnosing cancer in a patient. The telomerase can used in a method for diagnosing cancer in a patient. The telomerase can be used for detection, diagnosis and drug screening. Inhibitors of telomerase activity can be used to treat cancers such as melanomas, other telomerase activity can be used to treat cancers con carcinomas, colon carcinomas, skin cancers, lymphomas, osteosarcomas or smooth muscle cell hyperplasias col skin growths. Enhancers of telomerase may be used to stimulate stem cell proliferation and differentiation (expansion of haematopoietic stem cells could be administered in the bone marrow transplant context). As cells many tissues have stem cells. Proliferation of these cells may be useful in wound healing, hair growth, treatment of disease such as Wilm's tumour, organ regeneration or differentiation after injury or diseases, there cell or brain cell growth following injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Interest 196:1133-140 (1998).

In Constant of the property of trapping a seriesting sites in DNA have the property of trapping a certain fraction of sites in DNA have the property of trapping a certain fraction of elongating RNA polymerases that pass through, resulting in locked ternary complexes. Cleavage of the nascent transcript by cleavage factors such as grea A or grea allows the resumption of elongation from the new 3'terminus. Grea releases sequences of 2 to 3 nucleotides (By similarity).

In SIMILARITY: BELONGS TO THE GREA/GREB FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "Massive gene decay in the leprosy bacillus.";
Nature 409:1007-1011(2001).
-!- FUNCTION: Catalyzes the acyloin condensation reaction between C atoms 2 and 3 of pyruvate and glyceraldehyde 3-phosphate to yield 1-deoxy-D-xylulose-5-phosphate (DXP) (By similarity)
-!- CATALYTIC ACTIVITY: Pyruvate + D-glyceraldehyde 3-phosphate = 1-deoxy-D-xylulose 5-phosphate + CO(2).
-!- COPACTOR: Binds 1 thiamine pyrophosphate per subunit (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cole S.T., Eiglmeier K., Parkhill J., James K.D., Thomson N.R., Wheeler P.R., Honore N., Garnier T., Churcher C., Harris D., Mungall K., Basham D., Brown D., Chillingworth T., Connor R., Davies R.M., Davien R., Davies R.M., Davin K., Duthoy S., Feltwell T., Fraser A., Hamlin N., Murphy L., Oliver K., Quail M.A., Rajandream M.A., Rutherford K.M., Ruther S., Seeger K., Simon S., Simmonds M., Skelton J., Squares R., Barrell B.G.; Woodward J.R.,

```
The present sequence represents an antigenic peptide from human ct elementase reverse transcriptase (HTRT), from the present invention. The present invention also describes the following methods: (A) determining present invention also describes the following methods: (A) determining compensation of protein or polynucleotide, on administration of the compound; (B) preparation of recombinant telomerase by contacting a compound; (B) preparation of recombinant telomerase by contacting a compound; (B) preparation of from a telomerase RNA component; (C) protein preparation of hTRT with a telomerase RNA component; (C) protein of the hTRT RNA or protein in a sample by binding a relevant detection, amplifying the product and correlating the presence of RNA detection, amplification product and correlating the presence of C and (D) increasing the proliferation of a vertebrate cell by increasing call vertebrate cell proliferation of a vertebrate cell by increase in the manufacture of medicament that inhibits cell vertebrate cell proliferation of hTRT and the polynucleotide encoding ageing. A protein preparation of hTRT and the polynucleotide encoding effect of ageing or cancer. Inhibitors of telomerase activity can be used in the manufacture of medicaments for inhibiting the manufacture of medicaments and the new machods.
                                                                                              Pure and recombinant human Telomerase Reverse Transcriptase and its variants - are useful in the diagnosis, prognosis and treatment of cell proliferation conditions especially cancer and ageing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; telomerase reverse transcriptase; hTRT; TRT; diagnosis;
